SEASONALLY ADJUSTED INVENTORIES, ORDERS, AND SHIPMENTS IN MANUFACTURING INDUSTRIES - A TECHNICAL NOTE

In the long run the production and sale of endproducts determine trends in economic activity, but in short-run fluctuations business inventories usually play an important, indeed sometimes a dominant part, Accordingly business cycle analysts in recent years have focussed a great deal of attention on the behaviour of business inventories as a whole and on that of their constituent parts. The questions they ask are, in the light of the historical record. how large are inventories, in relation to output and in relation to sales? How high are unfilled orders. absolutely and in relation to sales, and what is the recent behaviour of new orders and how does it compare with sales? To answer these questions the movement of shipments from month to month in each industry and the change in inventory levels must be seen against the customary month to month pattern. Accordingly, the Bureau's programme has called for the seasonal adjustment of the series of manufacturers' inventories, orders and shipments, which have been available on an unadjusted basis for some years. These series were published for the first time in the March issue of the Canadian Statistical Review. It is the purpose of this note to describe the nature of the new series, to indicate the method of seasonal adjustment adopted and the reasons therefor.

The publication of the series introduced a new page of economic indicators into the "S" section of the Canadian Statistical Review, expanding and complementing the set of indicators already available. The new page contains seasonally adjusted series on inventories, shipments, ratio of inventories to shipments, new and unfilled orders for all manufacturing industries, and shipments and new orders for the capital goods (ex heavy transportation equipment) and the construction goods industries. The seasonally unadjusted counterparts of these series can be found in Table 26A of the Review. The historical record from 1952-60, seasonally adjusted, can be found for the most part in Inventories, Shipments and Orders in Manufacturing Industries, January, 1961.1 The historical record for the shipments and new orders for the capital goods (ex heavy transportation equipment) and the construction goods industries is not at present published but is available on request.

Monthly estimates of the dollar values of inventories, shipments, unfilled orders and new orders are obtained from a sample survey of manufacturing establishments. The monthly estimates for the year are revised annually on the basis of the Census of Industry. Detail regarding the sample survey and the quality of the data may be found in Inventories, Shipments and Orders in Manufacturing Industries, December 1960,² or in any other recent December report.

Raw data for inventories, shipments, unfilled orders and new orders are obtained from firms and are built up into aggregates on the basis of (1) the 17 groups in the Standard Industrial Classification System and (2) into 8 groups on the basis of the classification by economic use. Since many industries do not operate on an order basis, that is orders are normally covered as placed, series for new and unfilled orders are not applicable for all the groups in the first classification.

The data for shipments are an estimate of the value of shipments during the month and are adjusted for the fact that all months do not contain the same number of working days. The seasonal adjustment process is applied directly to the series for total shipments in all manufacturing industries and to total shipments in two components of the economic use classification, namely the capital goods (ex heavy transportation equipment) and construction industries.

Inventory data are estimated book values at the end of the month and therefore require no correction for calendar variation. The seasonally adjusted series for total inventories owned in all manufacturing industries is obtained by adding the seasonally adjusted component inventories of (1) raw materials, (2) goods in process, (3) finished products, and by subtracting, (4) the seasonally adjusted series for inventories held but not owned. This procedure gives a series similar in variability to one adjusted directly at the total level, but has the advantage of providing more detail.

The ratio of seasonally adjusted inventories to shipments, or the rate of turnover, is obtained by dividing the seasonally adjusted series for owned inventories by the seasonally adjusted total shipments in all industries.

Unfilled orders, like inventories, are estimates of values at the end of the month and therefore do not require adjustment for calendar variation. Unfilled orders are treated like shipments in that the seasonal adjustment process is applied directly to the series. The raw data for new orders are not obtained in the monthly survey as a direct question but are derived from the relationship of shipments to unfilled orders as follows:

"Unfilled orders at the end of the previous month, plus new orders during the month less shipments during the month, equals unfilled orders at the end of the current month".

The seasonally adjusted new orders series for the same industries as in the case of shipments are obtained by applying this formula to the seasonally adjusted data rather than to the raw series. The series so obtained tends to be less variable than those obtained by the direct seasonal adjustment of the raw data.

¹ Catalogue No. 31-001 Queen's Printer, Ottawa. No. 31-001, December, 1960, Queen's Printer, Ottawa.

Several considerations determined the choice of the method of seasonal adjustment just described. The first consideration was reliability, smoothness being one measure of reliability. After some experimentation, it was decided to use the 6 rather than 5 or 5½ day calendar adjustment for shipments, since this procedure seemed to give the best results. Considerations of smoothness also prompted the use of the "formula" as a basis for adjusting new orders rather than seasonally adjusting by the direct method. The same consideration determined the use of the seasonally adjusted data in the enumerator and denominator to obtain the ratio of shipments to

inventories, in preference to the seasonal adjustment of the ratio derived from the raw data. A

I

It was also considered important to choose those methods which would yield as much detail as possible, consistent with reliability. For this reason, it was decided to apply the seasonal adjustment to each of the broad components of inventories and to obtain the total by aggregation. The need for more detail is urgent and it is intended in future to adopt so far as possible the summation approach in the seasonal adjustment of shipments and orders.

A NOTE ON THE CANADIAN STATISTICAL REVIEW

This issue introduces a note which it is hoped will become a permanent feature of the Canadian Statistical Review. Its purpose is to indicate revisions and changes as they occur, and to provide other information which will be of help to users.

Changes in this Issue

1. Two indicators, namely, total iron and steel, and total transportation equipment, are added to Industrial Production (page S.1). The Charts are increased correspondingly, but the time period of the tabular material is reduced. (See Table 6 to obtain data for a longer period).

2. For this issue only, Table 6 is expanded to include raw and seasonally adjusted data from 1956 to the present. Data from 1958 on are revised and are continuous with the data found in Reference Paper No. 61-502, entitled, Revised Index of Industrial Production, 1935-1957. This issue of the Review provides, together with the Reference Paper and future Reviews, a continuous series of data back to January, 1946.

3. The values for the months for cyclical dominance (MCD) are added to the first half of Table 7. The definition of MCD is given below.

 The series for the ratios of inventories to shipments, raw and seasonally adjusted, are added to Table 26A.

5. The following three series, formerly appearing in Table 1, now appear as follows: Pulpwood Production (thousands of cords), in Table 32; Railway Revenue Freight Loading (thousands of tons), in Table 55; Three-Month Treasury Bill Yield, in Table 67.

Table 34B is expanded to include sales of new motor vehicles.

7. Table 65, on corporation profits, is expanded by providing a more detailed industrial breakdown and by adding the seasonally adjusted data for each industry.

The Purpose of the Tabular Sections

The series in the "S" Section are all seasonally adjusted and are selected from the detailed tabular material at the back, because they are believed to be good indicators of economic conditions, or because they summarize the movement of certain segments of the economy. Many of the series are charted in order to give, at a glance, the general movement of the series over the past few years. Where the series are very irregular, a moving average, generally of the term of the MCD (months for cyclical dominance, explained below) is drawn through the series in order to indicate its cyclical movement. Two years of annual data are included to facilitate monthly-annual comparisons.

The main tabular material, following the "S" Section, includes raw monthly, quarterly, and annual data, generally in a detailed breakdown. In addition, in some of the Tables, the seasonally adjusted counterparts to the raw data are available, as in Tables 5, 6, 7, 26A, 46 and 65. As the seasonal adjustment programme at the Bureau is developed, it is the intention to increase the number of these Tables.

Months for Cyclical Dominance (M.C.D.)

The months for cyclical dominance or MCD measure indicates the number of months required, on average, for emergence of the cyclical trend from the seasonally adjusted series. An MCD of five implies that a five-month moving average is required in order to offset irregular movements and allow examination of the underlying cyclical trend.

Moving averages of the term MCD are used to aid in the charting of several variable series in the "S" Section of the Review. It is also found in Tables 7, 26A, and 46, where it is used to indicate the relative variability of the series.

(i) Averages of unadjusted data. (ii) Employment indexes and average hours worked are compiled from data which relate to the last pay period of the month. The purpose of the moving average in the following charts is to indicate the underlying trend-cycle component as opposed to irregular factors. The moving averages are applied to the seasonally adjusted data and their lengths depend on a calculated measure called the M.C.D. or months for cyclical dominance.

LABOUR FORCE

Total employment remained unchanged in March. Unemployment amounted to 7.7 per cent of the labour force.

BUILDING PERMITS AND CONSTRUCTION

The total value of building permits declined by nearly 10 per cent in February, reflecting a sharp decline in government and institutional permits and a smaller decline in residential permits. However, there was a sizeable increase in industrial and commercial permits.

Housing starts declined by 8 per cent in March after registering gains for the preceding six months. Completions also declined sharply.

Note.—Until the end of 1959, annual data for births, deaths and marriages are based on tabulated figures by month of occurrence on the basis of residence. Figures for 1960 and 1961 are provisional and represent registrations filed in Provincial Vital Statistics offices during the month under review, regardless of the month of occurrences.

O'Yukon and North-West Territories not included in figures for births, marriages and deaths.

O'Estimates are now published quarterly following Census date, June 1, as well as for January 1 and July 1 of each year.

O'Exclusive of stillbirths.

d deaths.

⁸O'The seasonally adjusted data include an arbitrary smoothing of crop production, standard seasonal adjustments for livestock items and a seasonal adjustment for carnings of the Canadian Wheat Board. Because of the arbitrary elements too precise an interpretation should not be given the seasonally adjusted figures for this item.
O'Includes adjusting entry.
O'Includes residual error of estimate.
O'This item differs from column 5, bottom of page 6, in that it excludes undistributed earnings (and the inventory valuation adjustment) of the Canadian Wheat Board.

OSeasonal (formerly supplementary) benefit data included.

O'Company to the number of new cases of recorded unemployment among insured persons.

O'Commencing with november 1958, figures exclude fishing benefit claimants during the seasonal benefit period. Adjustments have been made in figures for November 1957-June 1958 which included fishing claimants.

O/The statistics for individual industries exclude strikes involving less than 100 workers. The total for all industries continues to include all strikes.

O/The annual and monthly "all industries" totals for 1959 and 1960 have been revised and are no longer quite comparable with the data for individual industries, apart from the difference described in footnote (1).

⁽a) In industries where long-term contracts involve the receipt of progress payments, all such payments are treated as sales. The series represents an estimated projection, on a monthly basis, of the latest available Census of Industry values.

(b) Total new orders received during the period, at estimated selling values. The series cover total New Orders, net of cancellations, regardless of whether the orders will be filled from stock or as a result of activity during the same month (and also be reported as shipments in the month received) or whether they will be added to existing backlogs.

(b) Estimated total unfilled orders on books at end of month, irrespective of work done on them or of stocks from which they can be filled, but less progress receipts in industries working on long term contracts. Sales in these industries include progress receipts. Estimates are derived by inflating the monthly reported values to total for each industry on the basis of the estimated year-end total values for each industry as obtained from annual surveys.

(c) Manufacturing inventory owned by manufacturers, held at plant or plant warehouse at end of period.

O'Releases of domestically manufactured tobacco for consumption in Canada.

O'End of period.

O'The production of beer is shown in thousand barrels of 25 gallons each.

O'Includes bottling of imported liquors.

⁽i)Monthly totals are not equivalent to annual data which include Newfoundland and Yukon and North West Territories for which only annual statistics are collected.
(i)Total pulp production covers "screenings" which are already included in exports. "Screenings" are excluded throughout from mechanical and chemical pulp.
(i)Rough cords of 128 cu. ft. (i)Customs exports. (ii)Mill shipments destined for export.

*Construction of dwelling units.

Note.—These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All Metropolitan Areas and Urban Centres with a population of 5,000 or more, along with certain other areas of high building activity, are enumerated completely. The remainder of the country is covered on a sample basis.

Note.—The data on building permits are collected for 1,014 municipalities and individual figures are available on request. Some of the annual totals for 1958 and 1959 differ slightly from the sum of the twelve monthly totals, due to the addition of statistics received too late to be included in the monthly data.

On the sum of the twelve monthly totals, due to the addition of statistics received too late to be included in the monthly data.

On the sum of the twelve monthly totals, due to the addition of statistics received too late to be included in the monthly data.

On the sum of the sum of the twelve monthly totals, due to the addition of statistics received too late to be included in the monthly data.

With coverage was extended to 507 municipalities in 1948, and as of 1959, stands at 1,014, minor revision still being required in the table, due to the non-receipt of returns from a few small places. No account is taken of the building activity outside of registration areas. Actual operations normally follow the granting of permits but a number of projects are not undertaken or abandoned. The amount depends upon the statement of the applicant and considerable change may develop before the completion of the operation.

(i) Monthly totals are not equivalent to annual data which include Newfoundland and Yukon and North West Territories for which only annual statistics are collected. (i) Planks and boards, flooring and square timber. (ii) Hollow blocks including fireproofing and load-bearing tile. (ii) For building insulation only. (iii) Figures cover the production of firms which normally account for 96 or each of the total for Canada. (iii) Florester yeales of firms which normally account for 96 of total Canadian production.

^{*}See also Tables 18 and 19. (*) Excluding Newfoundland. Western grain prices used in the construction of the Index prior to August 1, 1959 are final prices. From August 1, 1959 to July 31, 1960, the western grain prices used in the index are initial prices plus interim payments for wheat. Final prices for oats and initial prices for barley. Since August 1, 1960, only initial prices are available for these three grains.

Dominion premium up to September 1960. A rise in ratio favours production of beel.

Now they refer to all weights.

O'Overseas clearances plus U.S. imports for domestic use compiled from returns of Canadian elevator licensees and advice from American grain correspondents. Revised to include bagged seed wheat previously excluded.

Source: Coarse Grains Quarterly, Wheat Beview and Trade of Canada, D.B.S.

O'Customs exports are adjusted to reflect actual physical movement of wheat and wheat flour from Canada.

O'Annual data are monthly averages of crop year.

O'Includes eggs for hatching.

O'Customs exports are adjusted to reflect actual physical movement of wheat flour from Canada. Data shown for the last three months are not so adjusted.

O'Includes stocks held by manufacturers, wholesalers and other warehouses.

O'The increase in percentage of capacity from October to November, 1960 reflects the fact that some mills worked more than the 25 days included in this formula as well as a reduction in total daily capacity from 171,000 hundredweight in October to 151,000 hundredweight in November.

*Short term loans outstanding extended mainly but not entirely to consumers and for other non-business purposes, by selected financial institutions. The table does not include loans of trust and loan companies, second mortgage loans on residential real estate and loans of some other financial institutions for which comparable data are not available. (O'Conditional sale agreements held in connection with the financing of retail purchases of consumer goods.

Cash loans have no conditional sales contract but are usually repaid in instalments. O'Excluded from the above tableation are charge accounts and instalment credit in certain categories of dealers whose credit is extended mainly to farmers and other businesses rather than to consumers.

Wilneludes loans fully secured by marketable bonds and stocks, home improvement loans, etc.

O'Figures for dates other than year ends are estimated on the basis of the loans by twelve companies.

O'The trade figures have been adjusted to conform to balance of payments definitions of the international exchange of commodities.

(3) Balance also reflects all other current transactions.

(3) Whet sales (+) or purchases (-) by Canadians of Canadian and foreign securities (trading, new issues and retirements.)

Sources: Quarterly Estimates of the Canadian Balance of International Payments, D.B.S. and Statistical Summary of Bank of Canada.

(i) Note Circulation of Bank of Canada and chartered banks, excluding notes held by chartered banks. (ii) Subsidiary coin issued by the Mint less coin held by Bank of Canada and chartered banks in Canada. (i) Less total float, i.e. cheques and other items in transit (net). (ii) At September 30, 1957, the deposit balances of religious, educational and welfare institutions used for business purposes, about \$140 million, were reclassified from "personal savings deposits" to "other notice deposits". The figures prior to September 30, 1957 are thus not comparable with those since that date.

Note.—This series gives total new settled-for ordinary insurance sales in Canada, exclusive of revivals, increases, dividend additions, reinsurance acquired and pension bonds without insurance. Totals are estimates projected from the sales reported by 32 companies operating in Canada representing 89 per cent of new ordinary insurance sales.

O'The Canada totals by months for 1959 and 1960 do not correspond to the sum of the provincial totals as revisions applied to the national total are not yet available for the provinces. Neither the monthly figures for 1959 and 1960 nor the monthly averages for 1960 have been revised to agree with the Canada total.

Note.—The definition of profits before taxes is based mainly on the accounting definitions used by corporations. However, depletion charges are added back to net profits while Canadian dividends received are excluded from profits in order to avoid duplication. The term "profits" as used here means the total profits of all companies earning profits less the losses of all companies incurring losses. Estimates are based on profits as reported by a sample of all companies incorporated in Canada (excluding government-owned companies and incorporated co-operatives).

Olicludes, in addition to the industries listed, Agriculture, Forestry, Fishing and Construction.**

Olicludes, in addition to the industries listed, Tobacco and Leather.
